BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

Other Comments:

The search results generated for your recent request are attached. If you have any questions or comments (compliments or complaints) about the scope or the results of the search, please contact the BioTech-Chem searcher who conducted the search or contact:

Mary Hale, Supervisor, 308-4258 CM-1 Room 1E01

>	I am an examiner in Workgroup: (Example: 1610)
>	Relevant prior art found, search results used as follows:
	102 rejection
-	103 rejection
	☐ Cited as being of interest.
	Helped examiner better understand the invention.
	Helped examiner better understand the state of the art in their technology.
	Types of relevant prior art found:
	Foreign Patent(s)
	Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)
×	Relevant prior art not found:
	Results verified the lack of relevant prior art (helped determine patentability).
	Search results were not useful in determining patentability or understanding the invention.

Drop off completed forms at the Circulation Desk CM-1, or send to Mary Hale, CM1-1E01 or e-mail mary.hale@uspto.gov.

(TEXA-) TEXAS BIOTECHNOLOGY CORP.

WPI; 1996-221274/22.

New peptide(s) based on the LDV domain of fibronectin - used for inhibiting binding of alpha-4, beta-1 integrin to VCAM-1, fibronectin or invasin

Disclosure; Column 21-22; 35pp; English.

Surface of endothelial cells that line the interior wall of capillaries ourface of endothelial cells that line the interior wall of capillaries. C. VCAM-1 recognises and binds to the integrin alpha-debeta-1 (IAAB1) or VCAM-1 correction to the capillary and a betteroid meric protein present on the surface of certain white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cells migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cops. capable of blooding to the scene, causing widespread tissue damage. Cops. capable of blooding to the scene, causing widespread tissue damage. It is the stracellular matrix glycoprotein floronectin. Three distinct IAAB1-binding sites have been identified with fibronectin. One site is found in the Hepli region and is capable and contains the tripopide LDV as its minimal active affinity for IAAB1 and contains the tripopide LDV as its minimal active affinity for IAAB1 and contains the tripopide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CSI peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IAAB1 binding.

The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, DA, DGBA, GPRP, VTL, YIGSR, KQAGDV and/or RBDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The

The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha4betal. Integrins are cell bronectin) recognised by the integrin alpha4betal. Integrins are cell brones. The integrins of the cast proteins of adenoviruses binds to integrins. The integrins not only proteins of adenoviruses binds to integrins. The integrins not only proteins of adenoviruses binds to the extracellular matrix molecules. The mediate cellular adhesion to the extracellular matrix molecules. The acell in vitro having a particular cell surface binding site. The acell in vitro having a particular cell surface binding site. The adenovirus and a second component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the cell surface binding site. The adenovirus into the cell is contacted with it to allow entry of the adenovirus into the cell. The methods can be used for research and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Integrin-ligand; dissociator; disaggregation; platelet thrombus; stroke; fibrinogen; glycoprotein IIb-IIIa; angina; myocardial infarction; bone; osteoclast; osteoprosis; angiogenesis; cancer; diabetic retinopathy; psoriasis; tumour; atherosclerosis; inflammatory bowel disease; asthma; organ transplant rejection; arthritis; ILD.

                                                                                                                                                                                                                                                                                                         in existing platelet thrombus in a blood vessel is due to dissociation of fibrinogen from glycoprotein IIb-IIIa. This dissociation is caused by the binding of an integrin-ligand dissociation provides a method of disaggregating an existing platelet thrombus in a blood vessel, where the platelet comprises an existing platelet thrombus in a blood vessel, where the platelet comprises administering a compound which dissociates fibrinogen bound to a first site on platelet glycoprotein IIb-IIIa, by binding to a second interacting at compound which dissociates fibrinogen bound to a first site on platelet glycoprotein IIb-IIIa, by binding to a second interacting atte on platelet glycoprotein IIb-IIIa, by binding to a second interacting atte on platelet glycoprotein IIb-IIIa, and saggragating the platelet thrombus. The method is used to treat humans with unstable angina, stroke and/or acute myocardial infarction. The methods can be used to enact de-adhesion of osteoclasts from the bone surface to halt bone loss in a patient with osteoporcesis. The methods can also be used for the de-adhesion of angiogenic endothelial cells in a patient with a pathology. Condution associated with angiogenesis, e.g. cancer, diabetic retinopathy, psoriasis. The methods and also be used to treat tumours, atherosclerosis, inflammatory conditions, e.g. arthritis, inflammatory bowel disease, or organ transplant rejection, and aethma. The methods can be used for the dissolution of pre-formed platelet aggregates, which is a departure from the current strategy of treatment prior to formation of the processes of the processes and interaction of the plate of the plat
                                                                                                                                                                                                                                                                                                The invention relates to integrin ligand dissociators. Disaggregation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bone regenerative; osteopathic; osseous tissue; reconstitution; scaffold matrix; bone formation promoter; bone resorption inhibitor; cell adhesion; osteoblast; osteoclast; bone defect; fracture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            dissociator (ILD) that can be used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (1) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold car be designed to have a predetermined resorption/degradation rate, and may include regulatory compounds for specific cell types.
                                                                                                                                                                            System for reconstructing osseous tissue, useful e.g. for treating fractures, comprises scaffold containing promoter of bone formation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention
                                                                                                                                                                                                                                                                                                                 The invention relates to a novel system for reconstitution of osseous tissue comprising a scaffold carrying a compound (I) that promotes bone formation and a component that decreases bone resorption (II).

(I) induces migration and adhesion of osteoblasts and osteoclasts and (II) inhibits proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selectin or selectin binding fragments, proteins and peptides that facilitate call adhesion, plasminogen activator inhibitors. The poptides ANY80466-Y80492 are claimed metalloprocease inhibitors. The poptides ANY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ğ.

                                                                                                      The invention relates to peptidomimetic compounds (AAY77415-Y77438)

capable of inhibiting the binding of the VLA-4 integrin (alpha 4-beta-1, CD494(CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the extracellular matrix protein fibronectin (FW). VLA-4 is expressed on the surface of leukcytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukcyte adhesion to the CS-1 FN/VLA-4 interaction plays an important role in the inflammacory response. The peptidomimetics of the critical step in the inflammacory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatory activities, osteoarthritis and other skin inflammations, demyelinating diseases of the central nervous system conditions acterosis), allergies, atheroselerosis, colitie, diabetes, inflammatory bowel disease, atheroselerosis, colitie, diabetes, inflammatory bowel disease, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to comparison to the CS-1 peptide and therefore less expensive to the CS-1 peptide the CS-1 peptide to immobilised CS-1 peptide the CAS-1 peptide to inthibit VLA-4 Unrkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
peptidomimetic compounds used as cell surface fibronectin essing receptor and VLA-4 inhibitors for treating inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LDV peptide; VLA-4 inhibitor; very late antigen; alpha-4-beta-1; CD49d/CD29; cell adhesion; arylalkyl azolylalkanoic acid derivative; arylureidoalkyl azolylalkanoic acid derivative; inflammatory disorder; autolmmune disorder; respiratory disorder; LDV motif.

The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanoic acid derivatives and related compounds (1), and their salts and prodrugs. These are are integrin inhibitors, specifically of salts and prodrugs. These are are integrin inhibitors, specifically of VLA-4 (very late annigen 4, also known as alpha-4-beta-1 or CD494G/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-inducible cell surface protein VCAM-1 (vascular cell adhesion molecule-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and man their caspiratory disorders. These include asthma, arthritis, sutchimmune, or respiratory disorders. These include asthma, arthritis, sutchimmatory bowel disease. Sequences AAVS6918-V69502 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to the

The invention relates to a method for treating a mammal with, or at risk of developing, chronic renal failure, involving the administration of at least one integrin antegonist. The integrin antagonists that may be used in the method include antagonists of alpha-4-subunit containing integrins or antagonists of alpha-1-subunit containing integrins or antagonists of alpha-1-subunit containing integrins. In particular, the antagonists of alpha-1-subunit containing integrins. In particular, the antagonists of alpha-1-subunit integrin and tite organte aligand (collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAV-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, and exage renal disease, chronic diabetic nephropathy, diabetic nephrosts, opportensive glomerulosalerosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAR73466-AAR3466 represent periodes derived from the VLA-4 binding domain (CS-1 region) of therefore be used in the method of the invention. ö The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity Gaps Protection, endogenous therapeutic peptide; peptidase, conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter. ö Fibronectin fragment and fibrin related peptide SEQ ID NO:1142.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is given in a specification relating to a polypeptide comprising a series of heptad-repeats that mimic a transmembrane domain, and a selected cytoplasmic domain attached to the heptad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amino acid sequence to other heptad repeats in the series. The polypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying agents as inhibitors of alpha4 integrin biological
bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. It] are useful for modifying therapeutic peptidas e.g. hormonase, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes AAB90829 to AAB92441 represent peptides with physiological processes. exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to

responses by contacting the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin or paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin biological response. Inhibitors of the binding of paxillin to alpha4 are useful in blocking immune responses in conditions such as inflammatory bowel disease, arthritis, multiple sclerosis and asthma and in inhibiting atherosclerosis and scarring during wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to

The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA 4, 241-248, 1985
A;Title: Nucleotide sequence of Rhizobium meliloti 1021 nodulation genes: nodD is read of A;Reference number: A90951; MUD:85229955; PMID:4006668
A;Reference number: A90951; MUD:85229955; PMID:4006668
A;Accession: A03483
A;Abclecule type: DNA
A;Residues: 1-217 < AGBS
A;Cross-references: GB:X01649
A;Experimental source: strain 1021 symbiotic plasmid
C;Comment: This is one of the proteins, coded by nodulation genes, that are required for C;Genetics:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Lranscription antitermination factor nueg - Mycoplasma pneumoniae (strain ATCC 29342)

Lranscription antitermination factor nueg - Mycoplasma pneumoniae (strain ATCC 29342)

N.Alternate names: hypothetical protein D09_orf320

C;Species: Mycoplasma pneumoniae

A;Variety: ATCC 29342

C;Date: 26-Fb-1997 #sequence_revision 25-Apr-1997 #text_change 07-Dec-1999

C;Accession: S73413

R;Himmelreich, R:; Hilbert, H; Plagens, H:; Pirkl, E:; Li, B.C.; Herrmann, R.

aspartate-semialdehyde dehydrogenase (EC 1.2.1.11) - Shewanella sp. DSS12
N;Alternate names: aspartate beta-D-semialdehyde dehydrogenase
C;Species: Shewanella sp. DSS12
C;Date: 17-Jun-1997 #sequence_revision 18-Jul-1997 #text_change 20-Jun-2000
C;Accession: JC5436
E;Kato, C.; Smorawinska, M.; Li, L.; Horikoshi, K.
J. Biochem. 121, 717-723, 1997
A;Title: Comparison of the gene expression of aspartate beta-D-semialdehyde dehydrogenasr
A;Reference number: JC5435; MUID:97306055; PMID:9163523
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C;Accession: JC5435

A;Title: Genome sequence of enterchemorrhagic Escherichia coli 0157:H7.
                                                                                                                                                                                                                                                                                                                                                                                                                           te; the holoenzyme is completed by where the holoenzyme is completed by which the holoenzyme is completed for initiation of replication
A; Description: beta chain is required for initiation of replication
A; Note: can slide along duplex DNA bidirectionally and ATP-independent; binds core; cryst c; Superfamily: DNA-directed DNA polymerase III beta chain
C; Superfamily: DNA replication initiation; nucleotidyltransferase
C; Keywords: DNA replication initiation; nucleotidyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

high affinity transport system protein P37 - Mycoplasma pneumoniae (strain ATCC 29342)
N;Alternate names: hypothetical protein A05_orf380V
C;Species: Mycoplasma pneumoniae
A;Variety. ATCC 29342
C;Date: 10-Sep-1999 #text_change 10-Dec-1999
C;Accession: S73751
R;Himmelreich, R.; Hilbert, H.; Plagens, H.; Pirkl, E.; Li, B.C.; Herrmann, R.
Nucleic Angle Res. 24, 4420-4449, 1996
A;Title: Complete sequence analysis of the genome of the bacterium Mycoplasma pneumoniae
A;Reference number: S73327; MUID:97105885; PMID:8948633
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA-directed RNA polymerase, subunit A' (rpoA2) homolog - Archaeoglobus fulgidus
C;Species: Archaeoglobus fulgidus
C;Accession: H69485

FUNCTION: NECESSARY FOR EFFICIENT RNA POLYMERASE TRANSCRIPTION ELONGATION PAST TEMPLATE-ENCODED ARRESTING SITES. THE ARRESTING SITES IN DNA HAVE THE PROPERTY OF TRAPPING A CERTAIN FRACTION OF ELONGATING RNA POLYMERASES THAT PASS THROUGH, RESULTING IN LOCKED TERNARY COMPLEXES. CLEAVAGE OF THE NASCENT TRANSCRIPT BY CLEAVAGE FACTORS SUCH AS GREA OR GREB ALLOWS THE RESUMPTION OF ELONGATION FROM THE NEW 3'TERMINUS. GREA RELEASES SEQUENCES OF 2 TO 3 NUCLEOTIDES (BY SIMILARITY).
